I (about centers): cylinder $=1 / 2 \mathrm{mr}^{2}$, ring $/$ point $=\mathrm{mr}^{2}$, sphere $={ }^{2} / 5 \mathrm{mr}^{2}$, $\operatorname{rod}={ }^{1} / 12 \mathrm{~mL}^{2}\left(=1 / 3 \mathrm{~mL}^{2}\right.$ about end) 1. A mechanic needs to exert 385 mN of torque. He weighs 833 N and he stands on the handle of his wrench that is making a $17.0^{\circ}$ angle above the horizontal. How far from the center must he stand? (Be careful what you use for the angle)

2. What is the acceleration of a flywheel with a moment of inertia of $0.145 \mathrm{~kg} \mathrm{~m}^{2}$ if a torque of 2.80 mN acts on it?
3. A 0.680 m diameter flywheel has a moment of inertia of $0.243 \mathrm{~kg} \mathrm{~m}^{2}$. What is the angular acceleration of the flywheel if you exert 4.50 N tangentially at the edge to speed it up?
4. A 0.210 m radius grinding disk is spinning at 1350 RPM. If it goes through 85.0 rotations being brought to rest by a 1.20 N frictional force applied tangentially at its edge, what is the moment of inertia of the disk?
5. A 4.30 m diameter (cylindrical) merry go round going 45.0 RPM stops in 37.0 rotations because of an 8.30 N force applied tangentially at the edge. What is the mass of the merry go round?
