0 K

Write down the formula for converting:

Whiteboards: (These are solved on the website in the videos linked after the main one)

| 1. What is $37{ }^{\circ} \mathrm{C}$ in Kelvins? (310 K) | 2. What is 77.35 K in ${ }^{\circ} \mathrm{C}\left(-195.80{ }^{\circ} \mathrm{C}\right)$ |
| :--- | :--- |
| 3. What is $128^{\circ} \mathrm{C}$ in Kelvins? (401 K) |  |

$\qquad$
$\mathrm{P}=$ pressure in Pa (Absolute, not gauge)
$\mathrm{V}=$ volume in $\mathrm{m}^{3}$
$\mathrm{PV}=\mathrm{nRT}$
$\mathrm{n}=$ moles of gas molecules
$\mathrm{n}=$ mass $/$ molar mass
careful of: N O F Cl Br I H
$\mathrm{R}=8.31 \mathrm{JK}^{-1}$ (for these units)
$\mathrm{T}=$ ABSOLUTE TEMPERATURE (in K)

Example - Nitrogen cylinder is at a (gauge) pressure of 90.1 psi. It has a volume of 378 liters at a temperature of $37.0^{\circ} \mathrm{C}$. What is the mass of Nitrogen in the tank? ( N is 14.007 amu ) ( $2967 \mathrm{~g}=2.97 \mathrm{~kg}$ )

Whiteboards: (These are solved on the website in the videos linked after the main one)

| 1. What is the volume in liters of 1.00 mol of $\mathrm{N}_{2}$ at 0.00 ${ }^{\circ} \mathrm{C}$, and 1.00 atm ? $\left(1 \mathrm{~atm}=1.013 \times 10^{5} \mathrm{~Pa}\right)$ (22.4 liters) | 2. We have 34 g of $\mathrm{O}_{2}$ in 18.3 liters @ $23^{\circ} \mathrm{C}$. What pressure? $\left(1.43 \times 10^{5} \mathrm{~Pa}\right)$ |
| :---: | :---: |
| 3. What is the temperature if 52.0 g of He occupies 212 liters at a pressure of $2.15 \times 10^{5} \mathrm{~Pa}$ ? $\left(422 \mathrm{~K}, 149^{\circ} \mathrm{C}\right)$ | Draw a picture of a pretty pony here please if you haven't anything better to do |

$\qquad$

$$
\frac{P_{1} V_{1}}{n_{1} T_{1}}=\frac{P_{2} V_{2}}{n_{2} T_{2}}
$$

What must be true about Temperature and Pressure (and volume too):

Example - A nitrogen cylinder contains 3.42 kg of nitrogen at 2000 . psi absolute and $20.0^{\circ} \mathrm{C}$. What is the pressure if the temperature is $150 .{ }^{\circ} \mathrm{C}$, but you have released 0.20 kg of nitrogen? (2718 $\mathrm{psi} \approx 2720 \mathrm{psi}$ )

Whiteboards: (These are solved on the website in the videos linked after the main one)

| 1. An airtight drum at 1.00 atm and $10.0^{\circ} \mathrm{C}$ is heated <br> until it reaches a pressure of 1.15 atm . What is the new <br> temperature in ${ }^{\circ} \mathrm{C} ?\left(52.5{ }^{\circ} \mathrm{C}\right)$ | 2. An airtight cylinder has a pressure of 162 Jukkalas <br> when the piston is 14.5 cm from the bottom. What is <br> the pressure if the piston is moved to 17.2 cm from the <br> bottom of the cylinder? (Assume that the temperature <br> is the same) (137 Jukkalas ) |
| :--- | :--- |
| 3. A tyre is at 82 kPa gauge pressure when the <br> temperature is $10.0{ }^{\circ} \mathrm{C}$. What is the gauge pressure if <br> the temperature is $52{ }^{\circ} \mathrm{C}$ (assume the volume remains <br> constant, and that the tyre does not leak) <br> (211 kPa Absolute, 109 kPa Gauge) | Draw a very happy timberwolf eating with knife and <br> fork in this space: |

$\bar{E}_{\mathrm{K}}$ - Average KE of an ideal gas particle (J)
$\mathrm{k}_{\mathrm{b}}$ - Boltzmann's Constant $\left(1.38 \times 10^{-23} \mathrm{JK}^{-1}\right)$
$\bar{E}_{\mathrm{K}}=\frac{3}{2} k_{\mathrm{B}} T=\frac{3}{2} \frac{R}{N_{\mathrm{A}}} T$
T - absolute temperature in Kelvins
R - the gas constant $\left(8.31 \mathrm{JK}^{-1} \mathrm{~mol}^{-1}\right)$
$\mathrm{N}_{\mathrm{A}}-$ Avocado's number $\left(6.02 \times 10^{23} \mathrm{~mol}^{-1}\right)$

Name

Example \#1 - What is the RMS velocity of a helium atom in the thermosphere that is at $1800{ }^{\circ} \mathrm{C}$ ?
(The mass of a Helium atom is $(4.003 \mathrm{u}) \times\left(1.661 \times 10^{-27} \mathrm{~kg} / \mathrm{u}\right)=6.649 \times 10^{-27} \mathrm{~kg}$ )

Whiteboards: (These are solved on the website in the videos linked after the main one)

| 1. What is the average KE of an ideal gas molecule at <br> $37.0^{\circ} \mathrm{C} ?{ }_{\left(6.42 \times 10^{21} \mathrm{~J}\right)}$ | 2. At what temperature is the average KE of an ideal <br> gas molecule $1.20 \times 10^{-20} \mathrm{~J} ?(580 \mathrm{~K})$ |
| :--- | :--- |
|  |  |
| 3. What is the RMS speed of an atom of Neon-20 at <br> room temperature? <br> (Ne-20 $\left.=19.992 \mathrm{u}, 1 \mathrm{u}=1.661 \mathrm{x} 10^{-27} \mathrm{~kg}, \mathrm{~T}=20.0^{\circ} \mathrm{C}\right)$ <br> $(605 \mathrm{~m} / \mathrm{s})$ | 4. At what temperature is the RMS velocity of Helium <br> the same as Usain Bolt's PR average in the $100 \mathrm{~m} ?$ <br> $(100 \mathrm{~m}$ in 9.58 s$)$ <br> $\left(\begin{array}{ll}\left.\text { (He }=4.00 \mathrm{u}, 1 \mathrm{u}=1.661 \mathrm{x} 10^{-27} \mathrm{~kg}\right) \\ (0.0175 \mathrm{~K})\end{array}\right.$ |

What $\mathrm{V}_{\mathrm{p}}$ and $\mathrm{V}_{\text {rms }}$ mean:

What are the limitations of the ideal gas law? (i.e. when does it break down?)
In general:

Name
0. Energy Density: How many grams of petrol must you burn to release 100 kJ of energy? (2.22 grams)

$$
\text { efficiency }=\frac{\text { useful work out }}{\text { total work in }}
$$

$$
Q=m c \Delta T
$$

$$
=\frac{\text { useful power out }}{\text { total power in }}
$$

1. Heating Water: A water heater uses natural gas to heat 195 liters of water from $15.0^{\circ} \mathrm{C}$ to $59.0^{\circ} \mathrm{C}$. What mass of natural gas would this take for a $100 \%$ efficient heater? What if the efficiency is $56.0 \%$ $\left(\mathrm{c}_{\text {water }}=4186 \mathrm{~J} \mathrm{~kg}^{-1}{ }^{\circ} \mathrm{C}^{-1}\right)(0.653 \mathrm{~kg}, 1.17 \mathrm{~kg})$

## 2. Thermal Power Stations:

A coal fired electrical generation plant has an overall efficiency of $34.0 \%$ and generates an average of 180 . MW of electrical power. What quantity of a coal with a specific energy of 47.0 MJ kg -1 would this plant use in one week? $\left(6.81 \times 10^{6} \mathrm{~kg}\right)$

Whiteboard 1: A water heater uses natural gas to heat 180 . liters of water initially at $20.0^{\circ} \mathrm{C}$. If the heater has an efficiency of $54.0 \%$, what is the final temperature of the water after it has burned 0.500 kg of natural gas?
$\left(\mathrm{c}_{\text {water }}=4186 \mathrm{~J} \mathrm{~kg}^{-1}{ }^{\circ} \mathrm{C}^{-1}\right)\left(39.7^{\circ} \mathrm{C}\right)$

Whiteboard 2: A natural gas electrical generation plant puts out an average of 312 MW of power for a year, and in the process, uses $4.36 \times 10^{8} \mathrm{~kg}$ of natural gas. What is its overall efficiency? (41.0\%)

## 3. Wind Turbines:

The formulas:

$$
\begin{array}{ll}
\text { Power }=\frac{1}{2} A \rho v^{3} \quad \begin{array}{l}
\text { For wind power } \\
\mathrm{A}=\text { frontal area }\left(\pi \mathrm{r}^{2}\right) \mathrm{m}^{2} \\
\rho=\text { density of air }\left(\approx 1.3 \mathrm{~kg} / \mathrm{m}^{3}\right) \\
\\
\\
\mathrm{v}=\text { wind speed }
\end{array}
\end{array}
$$

Ex1 - What max power can you get from a wind turbine with 8.2 m long blades when the wind speed is about $5.4 \mathrm{~m} / \mathrm{s}$ on the average? Use the density of air to be $1.2 \mathrm{~kg} / \mathrm{m}^{3} \quad\left(2.0 \times 10^{4} \mathrm{~W}\right)$

Ex2 - What max power can you get from a wind turbine with 8.5 m long blades when the wind speed is about $7.3 \mathrm{~m} / \mathrm{s}$ incident on the front of the blades, and is slowed to $6.5 \mathrm{~m} / \mathrm{s}$ after the blades. Use the density of air to be $1.3 \mathrm{~kg} / \mathrm{m}^{3} \quad\left(1.7 \times 10^{4} \mathrm{~W}\right)$

Whiteboard: Your wind turbines have a radius of 9.70 m . They operate where the wind speed is $8.50 \mathrm{~m} / \mathrm{s}$, and they slow the wind to $7.60 \mathrm{~m} / \mathrm{s}$ on their downwind side. Use the density of air to be $1.3 \mathrm{kgm}^{-3}$

- What is the power output per turbine?
- How many turbines do you need to generate a megawatt of power? $\left(1.00 \times 10^{6} \mathrm{~W}\right)$ (33652.26963 W $\approx 3.37 \times 10^{4} \mathrm{~W}, 30$ turbines)

## 4. Pumped Energy Storage:

$$
\text { power }=\frac{\text { energy }}{\text { time }} \quad \Delta E_{p}=m g \Delta h
$$

Example: A $65.0 \%$ efficient pumped storage plant uses a reservoir that is 196 m higher than the generation site. What is its electrical power output if it is draining water from the reservoir a a rate of $1250 \mathrm{~kg} \mathrm{~s}^{-1}$ ? ( 1.56 MW )

Whiteboard: A pumped electrical storage facility generates 1.66 MW of power. It has a reservoir height of 130 . m, and releases 2240 kg of water per second. What is its overall efficiency? (58.1\%)

## 5. Solar:

1 kilowatt-hour $(\mathrm{kWh})=3.60 \times 10^{6} \mathrm{~J}$

Example: A photovoltaic panel measures 1.75 m by 1.10 m , and is $23.0 \%$ efficient. How much total electrical power can it put out if the solar intensity is $890 \mathrm{~W} \mathrm{~m}^{-2}$ ? How many Joules of electrical energy can it produce in a 6.00 hour period when the sun is hitting the panels? How many kWh of electricity? ( $394 \mathrm{~W}, 8.51 \times 10^{6} \mathrm{~J}, 2.36 \mathrm{kWh}$ )

Whiteboard: A house has a total of $12.8 \mathrm{~m}^{2}$ of solar panels that generate a power of 2045 Watts when the solar intensity is $750 . \mathrm{W} \mathrm{m}^{-2}$. What is the efficiency of the panels? ( $21.3 \%$ )
$\qquad$

## Conduction -

## Convection -

Radiation -

Ex 1: A star with a surface temperature of 5200 K has a radius of $6.5 \times 10^{8} \mathrm{~m}$, and is $1.7 \times 10^{11} \mathrm{~m}$ from a planet. Assume the star is a perfect black body. Calculate the intensity of the radiation in $\mathrm{Wm}^{-2}$ incident on the planet's upper atmosphere.

Ex 2: $606 \mathrm{Wm}^{-2}$ is incident on the upper atmosphere of a planet. If the planet's upper atmosphere has an albedo of 0.23 , a) What portion of the light makes it to the surface?
b) What is the average intensity of light over the whole surface of the planet?
c) What would be the equilibrium temperature of the planet in space if there were no greenhouse effect?
